

## Top Physics Formulas:

Here you will find the most common physics equations and formulas used in high school and fundamental university courses. These include, but are not limited to, mechanics, kinematics, energy, uniform circular motion, and waves formulas.

<b>Basic Mechanics Equations</b>	<b>2</b>
Velocity	2
Acceleration	2
Force	2
Weight	2
<b>Kinematics Equations (Equations of Motion)</b>	<b>2</b>
<b>Energy</b>	<b>3</b>
Gravitational Potential Energy	3
Kinetic Energy	3
Elastic Potential Energy	3
For more energy equations see here.	3
<b>Uniform Circular Motion</b>	<b>3</b>
Angular Velocity & Acceleration	3
Linear Velocity & Acceleration	3
Torque	4
<b>Waves &amp; Light</b>	<b>4</b>
Frequency of EM Wave	4
Velocity of EM Wave	4
Snell's Law	4

### Basic Mechanics Equations

Velocity

$$\bar{v} = \frac{\Delta x}{\Delta t} \quad v = \frac{dx}{dt}$$

Where  $x$  is the displacement and  $t$  the time. The first equation gives the *average* velocity while the second equation is the instantaneous velocity

Acceleration

$$\bar{a} = \frac{\Delta v}{\Delta t} \quad a = \frac{dv}{dt}$$

Where  $v$  is the velocity and  $t$  the time. The first equation gives the *average acceleration* while the second equation is the instantaneous acceleration

Force

$$F = ma$$

Where  $m$  is the mass of the object and  $a$  is the acceleration

Weight

$$w = mg$$

Where  $m$  is the mass and  $g$  is the gravitational acceleration. On earth, it is  $9.8 \text{ m/s}^2$ .

### Kinematics Equations (Equations of Motion)

1.  $v = v_0 + at$

2.  $\Delta x = \frac{v+v_0}{2}t$

3.  $\Delta x = v_0t + \frac{1}{2}at^2$

4.  $v^2 = v_0^2 + 2a\Delta x$

$\Delta x$  Displacement  
 $t$  Time  
 $v_0$  Initial Velocity  
 $v$  Final Velocity  
 $a$  Acceleration

- To be used under constant acceleration

## Energy

### Gravitational Potential Energy

$$PE_g = mgh \text{ [Joules]}$$

Where m is the mass of the object, g is the gravitational constant

$9.8 \text{ m/s}^2$ , and

h is the height of the object

For more energy equations see [here](#).

### Kinetic Energy

$$KE = \frac{1}{2} mv^2 \text{ [Joules]}$$

Where m is the mass of the object, v is the velocity of the object

### Elastic Potential Energy

$$PE_s = \frac{1}{2} kx^2 \text{ [Joules]}$$

Where k is the spring constant and x is the displacement

## Uniform Circular Motion

### Angular Velocity & Acceleration

$$\bar{\omega} = \frac{\Delta\theta}{\Delta t} \quad \omega = \frac{d\theta}{dt}$$

$$\bar{\alpha} = \frac{\Delta\omega}{\Delta t} \quad \alpha = \frac{d\omega}{dt}$$

Where theta is the angular displacement. The first equation gives the average angular velocity, while the second is the instantaneous angular velocity. The third equation gives the average angular acceleration, while the fourth is the instantaneous angular acceleration

### Linear Velocity & Acceleration

$$v = \omega r$$

$$a = \alpha r - \omega^2 r$$

The angular velocity  $\omega$  can be converted into a linear velocity  $v$  with this equation where r is the radius

The angular acceleration  $\alpha$  can be converted into a linear acceleration  $a$  with this equation where r is the radius

Torque  
 $\tau = r \times F$

Where F is the force acting in the direction of rotation, and r is the arm length

## Waves & Light

Frequency of EM Wave  
 $f = \frac{1}{T}$

Where T is the period of the wave

Velocity of EM Wave  
 $v = \lambda f$

Where  $\lambda$  is the wavelength and f is the frequency

Snell's Law

$$n_1 \theta_1 = n_2 \theta_2$$

Where  $n_1$  and  $n_2$  are the indices of refraction for the given mediums and  $\theta_1$  is the angle of incidence and  $\theta_2$  is the angle of refraction
